

Zomato Data Analysis

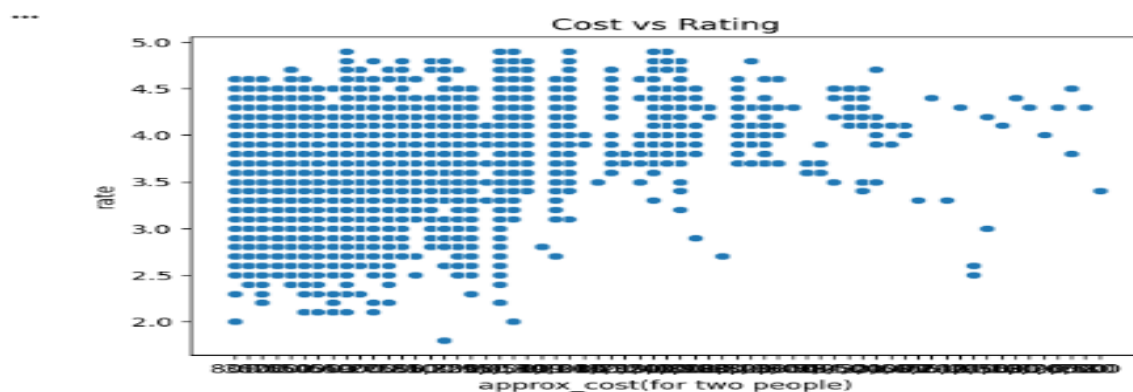

This project analyzes Zomato restaurant data to understand patterns in ratings, locations, and pricing. Most restaurants have ratings between 3.5 and 4.2, with fewer extremely high or low ratings. Location plays an important role in restaurant distribution, indicating higher demand in specific areas. Additionally, higher cost does not always guarantee better ratings. Based on these findings, recommendations include improving service quality, focusing on popular locations, and using customer feedback for improvement.

Most restaurants have ratings between 3.5–4.2.
Very few restaurants have low ratings.
Highly rated restaurants are limited.

Some locations have more restaurants than others.
This shows higher demand in those areas.

Higher cost does not always mean better ratings.
